► Elimination of red traces on walls

Biodegradable, non-dangerous treatment

## DESTINATION

**ABBAkil** is a biodegradable treatment designed to destroy red traces, also called “walls scab”, it also decontaminates surfaces, without any danger for the user and the environment. **ABBAkil** is based on a fungicide, bactericide and algicide vegetable-based active principle.

### SYMPTOMS AND DANGERS OF “WALLS SCAB”

Apart from its aesthetical aspect, “Walls scab”, damages rendering by retaining moisture which contains some acidic substances. These substances change colour from brown/red to yellow-orange when wet and when squashed with the finger.

These substances are also dangerous for the surfaces onto which they are let to grow. Furthermore, after developing from top to bottom in a comet-like manner, their ramifications will endanger neighbouring walls. Those will, after some incubation time, present the same unpleasant and aesthetical symptoms of “Walls scab”.

## SOLUTION

**ABBakil** is a ready-to-use disinfectant and bactericide cleaning solution. It is a professional product which has been specially adapted for the biological destruction of parasite plants through the sterilisation of the reproductive system.

Its formulation makes it a specific product for the treatment of this symbiotic association “fungus-algae”, remarkable in the countryside but undesirable on buildings.

## WORKING METHOD

**ABBakil** must be sprayed or applied with a brush on a basis of 1 litre for approximately 3 to 6 m<sup>2</sup>. It is important to apply the product evenly on the red traces as well as the surrounding area as we know that the surroundings are also contaminated but the plant has not visibly developed yet

In general, the aspect and colour of this ‘Walls scab’ will modify within the hour : **ABBakil** is working.

- 1 litre of **ABBakil** to treat on average 3 to 6 m<sup>2</sup>.
- Apply **ABBakil** on a dry and slight damp surface, with a rain-free weather for at least 2 to 3 hours.

## ULTERIOR TREATMENTS

If the surface has to be painted, it is possible to apply the paint once the surface is dry, without waiting or without caution regarding the **ABBakil** treatment which has just been implemented.

If the surface has to remain as such, in order to prevent another contamination, even in the long run, it can then be protected in either of the two following ways :

- Apply **ABBAmousses Plus**. This is both a preventive bactericide and an invisible waterproof (the surface can then also be painted if so desired).
- Or apply **ABBastop**, an invisible waterproof solution compatible further to treatment with **ABBakil** (the surface can also then be painted if so desired).

## PLEASE NOTE

A few well-advised professionals are aware of problems which the “Walls scab” can cause; they offer a preventive treatment based on **ABBAmousses** or **ABBAmousses Plus** to neighbouring buildings to infested zones, they know that the “scab” is there but invisible.

Our technical service is at our clients disposal for a diagnostic and choice of treatment.

Implemented by our **ABBA** approved professional operators, **ABBakil** + **ABBAmousses** can be guaranteed.

## PACKAGING

- 2-litre bottle
- 10-litre bottle
- 25-litre drum
